KOHLER®
SERVICE KIT INSTRUCTIONS

TRIP LEVER

NOTE: If possible, replace the trip lever before installing the toilet. The trip lever style may vary from the illustration shown.

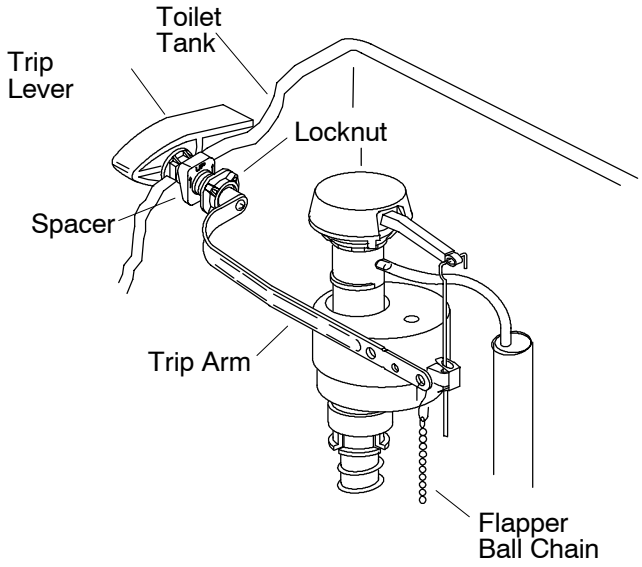

Disconnect the flapper ball chain from the existing trip arm. Remove the locknut by turning it clockwise. Remove the existing spacer (if included) and trip lever assembly from the tank.

NOTE: For a Wellworth toilet with right-hand trip lever (when facing the toilet), you will not need the plastic spacer. Please discard.

NOTE: For the Santa Rosa toilet (shown), you will not need the plastic spacer. Please discard.

Insert the trip arm of the replacement trip lever into the toilet tank hole. Install the spacer (if used) over the trip arm so the arrow on the spacer is upward and to the inside of the tank. Secure the trip lever assembly with the washer (if supplied) and locknut. The locknut has left-hand threads. Do not overtighten the locknut, or the trip lever will not move freely. If the assembly binds, loosen the locknut slightly until free movement is achieved.

Hook the flapper ball chain to the hole in the trip arm. Check for proper chain length, and adjust as needed. Trip arm movement should be free of interference. The trip lever should be horizontal when at rest.
